Abstract

Blockchain technology is being increasingly deployed to store and process transactions and information in the global financial sector. Blockchain underpins cryptocurrencies such as Bitcoin and facilitates decentralized finance (DeFi), representing a paradigm shift in the global financial landscape, offering alternative solutions to traditional banking, and fostering financial inclusion. In developing economies such as Morocco, where a significant portion of the population remains unbanked, these digital financial innovations present both opportunities and challenges. This study examines the potential role of cryptocurrencies and DeFi in enhancing financial inclusion in Morocco, where cryptocurrencies have been banned since 2017. However, the public continues to use cryptocurrencies, circumventing restrictions, and the Moroccan Central Bank is now preparing to introduce new regulations to legalize their use within the country. In this context, this article analyses the potential of cryptocurrencies to mitigate barriers such as high transaction costs, restricted access to financial services in rural areas, and limited financial literacy in the country. The study pursues a mixed-methods approach, which combines a quantitative survey with qualitative expert interviews and adapts the Unified Theory of Acceptance and Use of Technology (UTAUT) model to the Moroccan context. The findings reveal that while cryptocurrencies offer cost-efficient financial transactions and improved accessibility, their adoption may be constrained by regulatory uncertainty, security risks, and technological limitations. The novelty of the article thus lies in its focus on the key mechanisms that influence the adoption of cryptocurrencies and their potential impact in a specific national context. In so doing, the study highlights the need for a structured regulatory framework, investment in digital infrastructure, and targeted financial literacy initiatives to optimize the potential role of cryptocurrencies in progressing financial inclusion in Morocco. This underscores the need for integrated models and guidelines for policymakers, financial institutions, and technology providers to ensure the responsible introduction of cryptocurrencies in developing world environments.

Keywords: blockchain; cryptocurrencies; decentralized finance; financial inclusion; Morocco; financial regulation; financial literacy; digital infrastructure

1. Introduction

Digital transformation is reshaping traditional financial systems, offering unprecedented opportunities to enhance financial inclusion on a global scale (Arner et al., 2020;

Beck et al., 2015). However, in many emerging economies, a significant portion of the population remains excluded from formal banking services due to structural barriers such as high transaction costs, limited access to banking infrastructure, and low financial literacy levels (Kanga et al., 2022; Lyons & Kass-Hanna, 2021). In this context, cryptocurrencies and decentralized finance (DeFi) have emerged as alternative solutions, enabling secure, instantaneous, and low-cost transactions without the need for traditional intermediaries (Alamsyah et al., 2024; El Hajj & Farran, 2024).

Cryptocurrencies, powered by blockchain technology, have demonstrated their ability to reduce remittance costs, provide accessible investment opportunities, and offer financial services to unbanked populations (Guo et al., 2025). Beyond their functional benefits, DeFi protocols are increasingly demonstrating strong economic viability, as evidenced by rising Total Value Locked (TVL), trading volumes, and revenue indicators. These metrics reflect the growing maturity and resilience of DeFi ecosystems, positioning them as credible alternatives to traditional financial intermediaries in both developed and emerging markets (Metelski & Sobieraj, 2022). In several developing countries, these digital assets have been adopted as an alternative to conventional financial systems, in particular to facilitate cross-border payments, circumvent banking inefficiencies, and improve financial access in rural areas (Islam et al., 2023). Despite their disruptive potential, however, the adoption of cryptocurrencies faces significant challenges, including technological constraints, regulatory uncertainties, and a lack of public awareness (Mohammed et al., 2023).

This raises a fundamental question: can cryptocurrencies truly foster financial inclusion, and under what conditions? While their adoption presents innovative solutions, their effectiveness largely depends on the regulatory framework in place, the level of financial literacy, and the quality of available digital infrastructure (Shahzad et al., 2018). Without a structured regulatory framework and strategic integration into the financial ecosystem, these technologies risk exacerbating financial access inequalities rather than mitigating them (Ozili, 2023b).

This study analyses the role of cryptocurrencies and DeFi by identifying their potential benefits, the barriers to their adoption, and the key factors influencing their impact. Specifically, the article explores the relationship between cryptocurrency adoption and financial inclusion, examining the mediating role of financial literacy and the moderating effect of digital infrastructure (Kumari et al., 2023). To investigate these interactions, a mixed-method approach was adopted, combining a quantitative survey with qualitative interviews conducted with financial and technology experts. The analysis relies on a structural equation modeling (SEM) framework, allowing for the examination of complex relationships between variables and a deeper understanding of the underlying mechanisms influencing financial inclusion through cryptocurrencies (Ramayah et al., 2018).

This research is conducted in the specific context of Morocco, where the use of cryptocurrencies—despite being officially banned since 2017—has been steadily growing, raising questions about regulation and the potential impact of these technologies on the national economy (Xie, 2019). Following this introduction, Section 2 presents a literature review on financial inclusion and cryptocurrency adoption, drawing upon relevant theoretical models (Venkatesh et al., 2012). Section 3 then outlines the research methodology, justifying the choice of the mixed-method approach and the SEM model (Hair et al., 2019). Section 4 sets out and analyzes the empirical results, highlighting the key determinants of cryptocurrency adoption and their impact on financial inclusion. Finally, Section 5 discusses the implications of the findings, provides strategic recommendations for policymakers, and suggests future research directions.

By offering an in-depth analysis of the conditions necessary for the successful adoption of cryptocurrencies as a financial inclusion tool, this study contributes to academic and

practitioner research and assessment of the role of digital technologies in the transformation of financial services, particularly in emerging economies (Y. Chen & Bellavitis, 2020). It also builds on previous research on digitalization and corporate responsibility in the Moroccan context (Abdallah-Ou-Moussa et al., 2024) and aims to provide concrete recommendations to regulators, financial institutions, and technology innovators to promote the responsible and effective integration of cryptocurrencies into economic and social development strategies (El Chaarani et al., 2024).

2. Literature Review

This literature review comprises three sub-sections. First, an overview of the relevant literature relating to cryptocurrencies is provided, complementing that included in the Introduction Section above, noting particularly the linkage with financial inclusion. Then, in Section 2.2, relevant theoretical frameworks and models are briefly reviewed and assessed. To conclude, Section 2.3 considers the various dimensions included in existing frameworks as they relate to financial inclusion.

2.1. Cryptocurrencies and Financial Inclusion

The rise of digital technologies has profoundly transformed the financial sector by facilitating access to banking services and fostering monetary innovation. These changes are particularly significant in emerging economies, where financial exclusion remains a major challenge. In this context, cryptocurrencies have emerged as a promising alternative to the limitations of traditional banking systems, offering innovative solutions to overcome barriers to accessing financial services (Demirgüç-Kunt et al., 2020). However, their widespread adoption and diffusion depend on the complex interplay of technological, economic, social, and regulatory factors (Kouam, 2023).

Being one of the most disruptive innovations, cryptocurrencies—based on blockchain technology—are redefining the mechanisms of monetary exchange. This decentralized infrastructure ensures the security, transparency, and irreversibility of transactions, thereby enhancing user trust (Zohar, 2015). Since the emergence of Bitcoin in 2008 (Nakamoto, 2008), these digital currencies have been viewed as potential instruments for financial inclusion, particularly in regions where banking infrastructures are either insufficient or difficult to access (Gomber et al., 2018). They make it possible to bypass constraints related to having a bank account, high transaction fees, or geographical distance from banking agencies.

Nevertheless, despite their inclusive potential, the adoption of cryptocurrencies remains heterogeneous and limited in many regions. Several studies highlight barriers to their diffusion, including the technical complexity of digital interfaces (Steinmetz et al., 2021), price volatility (Baur & Dimpfl, 2021), the risk of fraud (Foley et al., 2019), and the absence of clear regulations in some countries (Auer et al., 2023; Schaupp et al., 2022). These factors contribute to a sense of mistrust and hinder the integration of cryptocurrencies into everyday financial practices, especially in fragile institutional contexts. Yet, as observed in the aftermath of the COVID-19 pandemic, perceptions of cryptocurrencies can shift significantly in response to broader socio-economic disruptions. In countries such as Poland and Germany, the health crisis prompted an increased openness toward digital financial tools, particularly among younger users, thereby reinforcing the role of cryptocurrencies as legitimate alternatives to traditional forms of money (Maciejasz et al., 2024).

2.2. Theoretical Frameworks and Multidimensional Determinants of Cryptocurrency Adoption

To understand the underlying mechanisms driving the adoption of these innovations, the literature draws upon various theoretical frameworks from economics, social sciences, and technology studies. The Technology Acceptance Model (TAM), proposed by Davis

(1989), remains one of the most frequently used models. It posits that the intention to adopt a technology is primarily based on two dimensions: perceived usefulness and perceived ease of use (Davis et al., 1989; Islam et al., 2023). In the case of cryptocurrencies, these elements are reflected in the ability to conduct secure transactions at a low cost, as well as the perceived complexity of using digital wallets or exchange platforms (Dabbous et al., 2022; Hidegföldi et al., 2025). From this perspective, Sham et al. (2023) found that the perceived usefulness of cryptocurrencies—particularly their ability to facilitate fast and low-cost transactions—was a central driver of adoption. However, this usefulness is often offset by the perception of technical complexity, which may constitute a significant barrier, especially for less experienced users. Alharbi and Sohaib (2021) emphasized the importance of perceived ease of use, noting that an intuitive interface, simplified access to digital tools, and a seamless user experience are all critical conditions for effective adoption, particularly among novice users.

This approach is complemented by the Unified Theory of Acceptance and Use of Technology (UTAUT) model (Venkatesh et al., 2000, 2003). This model introduces additional explanatory variables such as social influence, facilitating conditions (e.g., digital infrastructure, perceived trust), and performance expectancy (Al-Saedi et al., 2020; Williams et al., 2015). It has been applied in recent studies on digital transformation and user engagement within the Moroccan insurance sector, where social and behavioral commitment emerged as key factors influencing technological adoption (Abdallah-Ou-Moussa et al., 2025). In emerging economies, these factors take on particular importance, as adoption behaviors are heavily influenced by peer perceptions, trust in digital tools, and the availability of an adequate technological environment (Shahzad et al., 2018; Alkhwaldi, 2024; Shuhaiber et al., 2025).

X. Chen et al. (2022) and Alomari and Abdullah (2023) concluded that both social influence and facilitating conditions—particularly the availability of reliable digital infrastructure—are key determinants in the adoption of cryptocurrencies in developing countries. At the same time, Yeong et al. (2019) pointed out that sociodemographic variables such as age, income, and education level significantly shape individuals' perceptions of usefulness and ease of use regarding these financial technologies.

In parallel, the Diffusion of Innovations Theory (Rogers, 2003) provides an analytical framework for examining the speed and patterns of cryptocurrency adoption among different user categories. It identifies several key characteristics influencing adoption, including relative advantage, compatibility with existing values and needs, perceived complexity, trialability, and observability. Within this framework, cryptocurrencies may be perceived as value-generating innovations, yet their accessibility and comprehensibility remain limited for large segments of the population, particularly in contexts marked by low literacy levels or insufficient digitalization (Böhme et al., 2015). In this regard, Rzaev et al. (2025) emphasize that the diffusion of cryptocurrencies is closely related to their ability to integrate with existing financial practices and to address users' specific needs. This perceived compatibility thus emerges as a structuring factor in the adoption process, facilitating the appropriation of cryptocurrencies by users with diverse profiles and expectations (Sousa et al., 2022).

In the wider context of information technology deployment and digital transformation, a number of frameworks and models provide guidance for technology implementation, as opposed to measuring acceptance factors. The TOE model (Depietro et al., 1990) is perhaps one of the most popular frameworks for evaluating the adoption of technologies in a variety of contexts. The model suggests that there are three main sets of factors—technological, organizational, and external environmental—which are seen as fundamental in decision-making regarding the implementation of new technologies. In an African context, Van Dyk

and Van Belle (2019) used the TOE model to evaluate digital transformation in South African retail organizations. Similarly, Olayinka and Wynn (2022) utilized the model to evaluate e-business implementation in Nigerian companies, but also combined elements of other models to provide a four-stage Engage–Deploy–Exploit–Transform (EDET) framework to track technology implementation. Heeks's (2002) Design–Actuality gap has also been widely adapted to track technology change initiatives in developing world contexts, based on the model's four change dimensions of Technology, Process, People, and Structure. This includes studies of technology deployment in Iran (Rezaeian & Wynn, 2016) and Libya (Akeel & Wynn, 2015).

More specifically as regards the diffusion of cryptocurrencies, Hidegföldi et al. (2025) highlighted the complexity of the implementation process underlining the close interaction between technological, social, and economic dimensions. These multiple interdependent factors explain the diversity of integration trajectories observed globally. From a critical perspective, Shin and Rice (2022) made the point that cryptocurrencies do not evolve in a neutral vacuum, but rather within specific institutional configurations shaped by local political, economic, and social structures, which influence both their perception and appropriation. Similarly, Bhimani et al. (2022) demonstrated that cryptocurrency adoption is strongly conditioned by structural factors such as the quality of governance, level of financial literacy, and access to digital infrastructure. These elements play a decisive role in the capacity of individuals and institutions to appropriate blockchain-based innovations. The case of China, analyzed by Allen et al. (2022), illustrates how cryptocurrencies and central bank digital currencies can, in certain contexts, act as catalysts for the structural transformation of the financial system by finely adapting to local economic and social needs.

2.3. Financial Literacy, Digital Infrastructure, and Institutional Environments: Drivers and Constraints of Inclusion

In addition to these structural factors, individual user characteristics—particularly their level of financial literacy—emerge as central determinants of cryptocurrency adoption. Beyond technological and behavioral dimensions, the recent literature has emphasized the importance of socio-educational conditions in the appropriation of financial innovations. Financial literacy, defined as the ability to understand, interpret, and effectively use financial information, appears as a fundamental lever for empowerment in digital environments. As Lusardi and Mitchell (2014); Morgan (2021); Alomari and Abdullah (2023); M. T. I. Khan (2023); and Mhlanga (2023) all noted, individuals with a high level of financial knowledge are better equipped to adopt emerging financial technologies in an informed manner, evaluating both the benefits and risks associated with their use.

Conversely, financially illiterate populations—often drawn from vulnerable groups—are more exposed to risks of fraud, loss of funds, and limited understanding of cryptographic mechanisms (Auer et al., 2020). Alomari and Abdullah (2023), as well as Long et al. (2023), confirmed that financial literacy plays a moderating role in cryptocurrency adoption by strengthening user trust and reducing perceived risks. Morgan (2021) also emphasized that financial education is an essential pillar in promoting the responsible adoption of cryptocurrencies, particularly in regions where traditional financial systems are failing. Ultimately, financial literacy is not merely a protective factor—it is a prerequisite for active, critical, and secure participation in new digital ecosystems.

Moreover, the adoption of cryptocurrencies is closely tied to the availability and quality of digital infrastructure. Internet access, ownership of compatible mobile devices, and the stability of network connections are among the key technical prerequisites, without which the effective use of digital wallets and exchange platforms remains compromised. In this regard, Resource Dependence Theory (Celtekligil, 2020; Pfeffer & Salancik, 2015) suggests that the successful integration of any technological innovation depends on the

availability of adequate material and institutional resources. In other words, adoption can only occur in environments with the structural capacities necessary for its appropriation.

This infrastructural requirement presents a major obstacle in many regions of the Global South—particularly Sub-Saharan Africa, South Asia, and Latin America—where digital divides persist. As highlighted by [Nchofoung and Asongu \(2022\)](#) and [Asongu and Nwachukwu \(2019\)](#), weak networks, limited access to digital tools, and precarious technological infrastructures considerably reduce the prospects of financial inclusion through blockchain technologies. In the same vein, [L.-W. Wong et al. \(2020\)](#) emphasized that the adoption of blockchain technologies, including cryptocurrencies, is heavily influenced by the quality of digital infrastructure and the availability of technological resources. Likewise, [Schuetz and Venkatesh \(2020\)](#) confirmed that in developing countries, cryptocurrency adoption is often constrained by insufficient infrastructure and unequal access to information technologies.

A more systemic perspective is provided by Complexity Theory ([Kauffman, 1993](#)), which views adoption trajectories as non-linear and often unpredictable dynamics. This approach highlights the multiple technological, economic, social, and regulatory interactions that coexist in a constantly reconfiguring financial ecosystem ([Nishibe, 2024](#)). In this framework, outcomes do not always follow direct causal logic, but result from emergent processes, highly sensitive to contextual and institutional variations ([Goutte et al., 2023](#); [Shin & Rice, 2022](#)).

The case of Morocco offers a particularly revealing illustration of the complexity surrounding cryptocurrency adoption dynamics in constrained regulatory contexts. Although the Bank Al-Maghrib (the Central Bank of the Kingdom of Morocco) officially banned the use of crypto-assets in 2017, their informal use has continued to grow among the population. This parallel adoption is explained by a combination of structural factors: mounting economic pressure, the search for alternatives to traditional transaction mechanisms, and persistent distrust toward conventional financial institutions. As [Bziker \(2021\)](#) highlighted, this dynamic reflects a strategy of circumventing legal frameworks, with cryptocurrencies emerging as a pragmatic response to urgent needs for secure exchanges and value preservation. In a broader perspective, [Howson and de Vries \(2022\)](#) noted that such behavior is commonly observed in vulnerable communities, where cryptocurrencies become substitutes for institutional financial services, often perceived as inaccessible or ineffective. This trend is not unique to Morocco: Oxford Analytica ([Analytica, 2022](#)) observed sustained growth in the cryptocurrency market across the Middle East and North Africa (MENA) region, despite prevailing regulatory restrictions, reflecting a growing adoption that transcends legal frameworks. In this context, [Nandal et al. \(2024\)](#) pointed out that this rapid expansion raises significant legal and policy challenges, calling for a revision of existing legislative frameworks to support and channel these new monetary practices in a controlled and secure manner.

In Sub-Saharan Africa, for instance, countries such as Nigeria and Kenya have adopted hybrid regulatory models that tolerate the informal use of cryptocurrencies while exploring central bank digital currencies (CBDCs) to maintain monetary sovereignty ([Ozili, 2023a](#)). These approaches reflect a pragmatic balance between innovation and control, yet they often lack robust consumer protection mechanisms and struggle to reach rural populations due to infrastructural limitations ([G. Kumar et al., 2024](#)). Conversely, South Asian economies such as India have oscillated between restrictive policies and cautious legalization, with recent initiatives aimed at taxing digital assets while issuing regulatory guidelines to combat financial crime and capital flight ([Muralidhar & Lakkanna, 2024](#)). In both contexts, fragmented oversight and insufficient coordination between financial authorities remain major obstacles to the secure deployment of cryptocurrencies.

In Europe, the recent implementation of the Markets in Crypto-Assets (MiCA) regulation by the European Union represents a significant milestone in establishing a harmonized legal framework for crypto-assets, designed to protect investors while supporting innovation across member states such as the United Kingdom (Wang, 2024). This regulation imposes transparency requirements on crypto-asset issuers and trading platforms, thereby contributing to the reduction in information asymmetry and systemic risk. Similarly, Scandinavian countries, notably Sweden and Finland, have embraced highly digitized financial environments supported by advanced digital identity systems, which enable regulators to effectively monitor digital transactions while ensuring secure user integration. Meanwhile, in the United States, Hayashi and Routh (2025) emphasized that cryptocurrency adoption remains closely tied to financial literacy and risk tolerance—two factors that directly influence investment behavior within regulated environments.

In Asia, and particularly in China, the regulatory focus has shifted toward sovereign digital currencies and strict control of decentralized crypto assets. The rollout of the digital yuan illustrates how state-led initiatives can foster financial inclusion while preserving financial integrity—though such approaches raise concerns regarding data privacy and centralized surveillance (Allen et al., 2022). Meanwhile, Japan and Singapore have emerged as global leaders in crypto regulation, adopting licensing systems and multi-tiered, risk-based frameworks that foster market confidence while ensuring compliance with international anti-money laundering (AML) standards (Dirk Zetsche et al., 2020). In this context, M. Kumar and Thakur (2024) provide a detailed mapping of cryptocurrency and blockchain legal environments across different national systems, emphasizing the importance of modular frameworks tailored to local legal and cultural specificities.

This dynamic underscores the urgent need to rethink existing legal and institutional frameworks. Ferreira and Sandner (2021), building upon the work of Cermeño (2016), emphasized that the establishment of clear, balanced, and context-sensitive regulations is a *sine qua non* condition for ensuring responsible adoption, while also protecting users from systemic risks and the inherent volatility of cryptocurrencies.

Beyond the well-documented socio-economic and regulatory barriers to cryptocurrency adoption, recent research has begun to highlight a convergence in the statistical behavior of crypto-asset markets with that of traditional financial instruments. In a landmark study, Wątorrek et al. (2021) demonstrated that the cryptocurrency market, initially peripheral, has undergone rapid structural self-organization, leading to statistical properties increasingly resembling those of mature markets such as Forex, equities, and commodities. Using advanced methods from statistical physics—such as multifractal cross-correlation analyses and correlation matrix network formalisms—the authors showed that the cryptocurrency ecosystem exhibits heavy-tailed return distributions, volatility clustering, and long memory, all hallmark features of complex financial systems. These findings are further supported by Kyriazis et al. (2020), who identified bubble dynamics and volatility spillovers that align with behaviors historically observed in conventional markets. Similarly, Özdemir (2022) used wavelet and DCC-GARCH methods to trace volatility transmission between cryptocurrencies and traditional financial assets during the COVID-19 pandemic, confirming an increasing level of interdependence. This growing empirical evidence suggests that cryptocurrencies are no longer isolated experimental assets, but are increasingly integrated into the global financial architecture, sharing its benefits and systemic risks (Xu et al., 2021; Borri, 2019).

3. Research Method

This section sets out the various elements of the adopted research method. First, an overview of the research process is provided. Section 3.2 then notes data collection methods,

entailing both a 500-respondent survey and semi-structured interviews. Sample selection, measures, and variables are discussed in Section 3.3, followed by detail on the structural model, provisional conceptual framework, and the three main hypotheses in Section 3.4. Finally, Section 3.5 sets out the data analysis techniques deployed in the study.

3.1. General Approach

This study adopts a mixed-methods approach (Venkatesh et al., 2013), combining both quantitative and qualitative techniques to explore the role of cryptocurrencies and DeFi in financial inclusion in Morocco. The objective is to analyze the complex relationships between cryptocurrency adoption, barriers to financial inclusion, and mediating factors such as financial literacy and digital infrastructure. To achieve this, a structural equation modeling (SEM) framework is used to model these relationships and test related hypotheses. The adopted research philosophy is pragmatic, involving both deductive (survey) and inductive (interview) approaches. This facilitated the capture of both the objective dimensions (quantitative data) and the subjective perspectives (qualitative insights) of the phenomenon under study. This is discussed in more detail below.

3.2. Data Collection

The quantitative surveys targeted unbanked or underbanked individuals residing in both urban and rural areas of Morocco. Data collection was conducted through both face-to-face and online-administered questionnaires to ensure a diverse range of profiles were included. This phase of data collection was carried out over a period of three months. In contrast, qualitative interviews involved fifteen experts from various backgrounds, including representatives from banks, financial institutions, fintech startups, and academics specializing in blockchain and finance. These interviews followed a semi-structured approach (Miles, 1994), based on an outline guide covering the study's key themes. Each interview, lasting between 45 and 60 min, was recorded with the participants' consent.

3.3. Sample Selection, Measures and Variables

The study sample was structured according to two complementary approaches. For the quantitative component, a sample of 500 respondents was selected to ensure statistical representativeness (Krejcie & Morgan, 1970). A stratified sampling method was employed to guarantee a balanced distribution between urban and rural areas, as well as across different socio-economic categories, taking into account income and education levels. Eligibility criteria required participants to be at least 18 years old and reside in Morocco. For the qualitative sample, expert selection was based on their expertise in finance, blockchain technology, and public policy. Particular attention was given to ensuring diversity among profiles, incorporating stakeholders from the public sector, private sector, and academia to provide a holistic and multidimensional perspective on the issues under study.

The structural equation model (SEM) used in this study includes several latent variables, such as cryptocurrency adoption, measured by usage frequency, transaction amounts, and cryptocurrency knowledge; financial inclusion, measured by access to financial services, use of bank accounts, and participation in formal economic activities; financial literacy, assessed by a score based on the understanding of basic financial concepts; and digital infrastructure, measured by access to the internet, smartphone ownership, and connectivity quality. The observable variables specific to each latent variable are detailed, with indicators such as usage frequency, transaction amounts, and cryptocurrency knowledge for cryptocurrency adoption, or the number of bank accounts and the frequency of financial services usage for financial inclusion.

The measurement instruments include a structured quantitative questionnaire divided into sections corresponding to the latent variables, based on validated scales from theo-

retical models, such as the UTAUT, TAM, and Theory of Planned Behavior (Yoon, 2011), using 5-point Likert scales to measure perceptions and behaviors. A qualitative interview guide was used to explore expert perceptions on cryptocurrency adoption and financial inclusion, with open-ended questions designed to gather insights on topics like regulation, security, and the impact of cryptocurrencies on unbanked populations. The qualitative data were analyzed using thematic analysis, including verbatim transcription of the interviews, open coding to identify emerging themes, and result validation to ensure the reliability and consistency of the interpretations. The main themes identified include cost reduction, access to rural areas, regulation, security, and financial literacy, grouped into broader categories to facilitate interpretation.

3.4. Structural Model, Provisional Conceptual Framework and Hypotheses Development

SEM was selected for this study because of its ability to model complex relationships between multiple latent and observable variables (Fornell & Larcker, 1981; K. K.-K. Wong, 2013). SEM allows for:

- Validating an integrated theoretical model by simultaneously testing the relationships between cryptocurrency adoption, financial inclusion, and mediating factors (financial literacy, digital infrastructure).
- Analyzing both direct and indirect effects: for example, the impact of cryptocurrencies on financial inclusion may be mediated by financial literacy.
- Managing latent variables of concepts such as financial inclusion or financial literacy, which cannot be directly measured but are modeled from observable indicators.

The structural model is represented by the following equation:

$$\eta = B\eta + \Gamma\xi + \zeta \tag{1}$$

- η is the vector of dependent latent variables (financial inclusion).
- ξ is the vector of independent latent variables (cryptocurrency adoption).
- B and Γ are the matrices of structural coefficients.
- ζ is the error term.

A provisional conceptual framework was developed based on the review of the extant literature and the models discussed above (Figure 1). From here, three hypotheses were postulated, exploring direct, mediating, and moderating relationships between the main constructs:

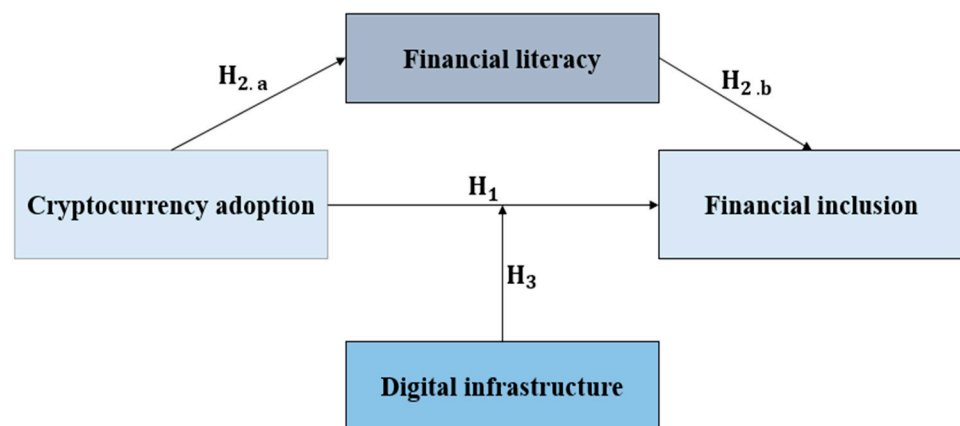

Figure 1. Provisional conceptual framework.

H1: Cryptocurrency adoption has a direct positive impact on financial inclusion.

H2: *Financial literacy mediates this effect.*

H3: *Digital infrastructure moderates the effect of cryptocurrencies on financial inclusion.*

These hypotheses were tested in the primary research phase of the project. The analysis techniques are now discussed below.

3.5. Data Analysis

The data analysis was conducted in several stages, starting with a preliminary analysis that included descriptive statistics to summarize the characteristics of the sample, an assessment of the reliability of the measurement scales using Cronbach's Alpha, and an exploratory factor analysis to verify the validity of the instruments. Following this, an SEM was applied, incorporating a confirmatory factor analysis (CFA) to validate the structure of the latent variables and their indicators (Jorgensen et al., 2012), followed by a structural model to test the relationships between the latent variables.

The fit indices used to evaluate the model's quality include a Comparative Fit Index (CFI) greater than 0.90, a Tucker–Lewis Index (TLI) also greater than 0.90, and a Root Mean Square Error of Approximation (RMSEA) less than 0.08. At the same time, qualitative data from interviews were transcribed and analyzed through thematic analysis to identify recurring patterns and key insights. The methodology, combining quantitative and qualitative approaches with an SEM model, allows for a thorough and multidimensional analysis of the role of cryptocurrencies in financial inclusion in Morocco. The results from this analysis provide new insights of relevance to policymakers, financial institutions, and fintech sector stakeholders.

4. Results

This Results Section has two parts. First, the demographic characteristics of the survey respondents are analyzed, examining aspects relating to reliability and validity. The results of the testing of the three hypotheses are then set out, based on the SEM and confirmatory factor analysis (CFA).

4.1. Demographic Characteristics of the Sample

The majority of respondents (75%) are between 18 and 45 years old, reflecting a relatively young population (Table 1). This suggests that young adults are more likely to be exposed to cryptocurrencies and emerging financial technologies, potentially influencing their adoption. As regards gender, the sample is slightly male dominated (55%), which may indicate a gender disparity in cryptocurrency adoption. Further studies could explore whether this trend is due to differences in access, interest, or financial literacy between genders. In total, 75% of respondents have a secondary or university education level, suggesting that cryptocurrency adoption may be higher among educated populations.

This highlights the importance of financial and digital literacy in the adoption of these technologies. 50% of respondents have a monthly income ranging between 3000 and 6000 Moroccan dirham (approximately 300–600 euro), representing a middle-class segment. This indicates that cryptocurrencies may be perceived as a viable financial option for this income group, but further initiatives may be needed to reach lower-income populations. A total of 65% of respondents have a bank account, while 35% are unbanked, suggesting that cryptocurrencies could play a key role in financial inclusion, particularly for unbanked populations in rural areas. Only 20% of respondents have used cryptocurrencies, indicating that adoption remains relatively low. This could be due to factors such as a lack of knowledge, restrictive regulations, or perceived risks.

Table 1. Descriptive statistics of the sample.

Variable	Category	Percentage
Age	18–30 years	40%
	31–45 years	35%
	46 years and above	25%
Gender	Male	55%
	Female	45%
Education Level	Primary or below	25%
	Secondary	40%
	University	35%
Monthly Income	Less than 3500 MAD	30%
	3500–6500 MAD	50%
	More than 6500 MAD	20%
Use of Financial Services	Bank account	65%
	Unbanked	35%
Cryptocurrency Adoption	Users	20%
	Non-users	80%

The results validate the reliability and convergent validity of the measurement scales (Table 2). For the four main concepts included in the study (Figure 1), considered here as latent variables, all Cronbach's Alpha values exceed 0.70, indicating excellent internal reliability of the measurement scales. This confirms that the indicators used to measure each latent variable are consistent and reliable. The high values of rho_a (Dijkstra–Henseler rho) and rho_c (composite reliability)—all being above 0.80—further reinforce the consistency of the measurements and confirm that latent variables are well represented by their respective indicators. All AVE (Average Variance Extracted) values exceed 0.50, indicating good convergent validity. This means that the indicators capture a significant portion of the variance of the latent variable they are intended to measure.

Table 2. Reliability and convergent validity.

Latent Variable	Cronbach's Alpha	rho_a	rho_c	AVE
Cryptocurrency Adoption	0.82	0.85	0.88	0.65
Financial Inclusion	0.78	0.80	0.85	0.70
Financial Literacy	0.85	0.86	0.89	0.60
Digital Infrastructure	0.80	0.81	0.84	0.72

The internal consistency and convergent validity of the latent variables is depicted graphically in Figure 2.

Discriminant validity can also be assessed (Table 3). For each latent variable, the square root of AVE is greater than the correlations with other latent variables. This confirms that the latent variables are distinct from one another and measure different concepts. For example, cryptocurrency adoption (AVE = 0.81) is distinct from financial inclusion (correlation = 0.50) and financial literacy (correlation = 0.45). Ensuring discriminant validity is of value because it confirms that relationships tested in the SEM model are not biased

by conceptual overlaps between variables. These discriminant validity results are shown graphically in Figure 3.

Figure 2. Reliability and convergent validity metrics of the four latent variables.

Table 3. Discriminant validity (Fornell and Larcker Criterion).

Latent Variable	Cryptocurrency Adoption	Financial Inclusion	Financial Literacy	Digital Infrastructure
Cryptocurrency Adoption	0.81			
Financial Inclusion	0.50	0.84		
Financial Literacy	0.45	0.60	0.77	
Digital Infrastructure	0.55	0.65	0.70	0.85

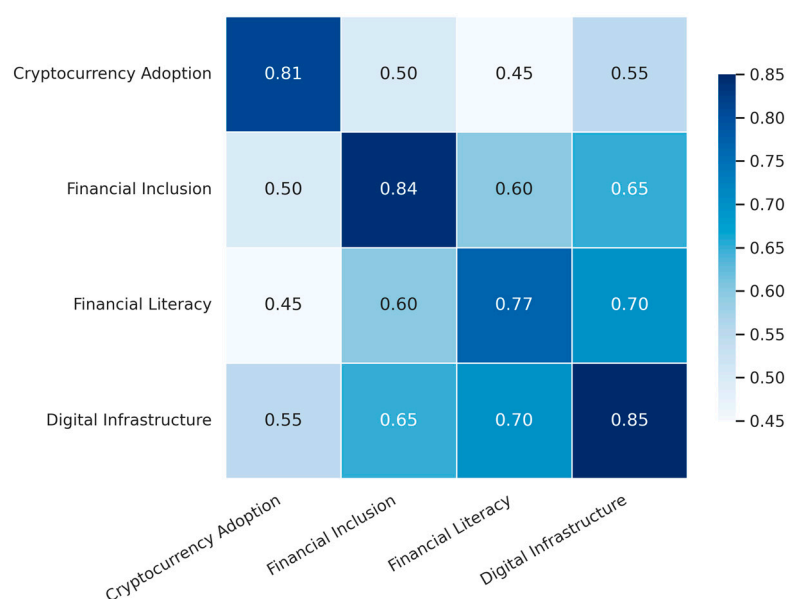

Figure 3. Discriminant validity matrix.

4.2. Results of Hypothesis Testing

The results of hypotheses testing are shown in Table 4 and are summarized as follows:

Table 4. Hypothesis testing results.

Hypothesis	Tested Relationship	Coefficient (β)	p -Value	Result
H1: Cryptocurrency adoption has a positive impact on financial inclusion.	Cryptocurrency Adoption \rightarrow Financial Inclusion	0.45	<0.001	Supported (positive and significant impact)
H2: Financial literacy mediates the effect of cryptocurrencies on financial inclusion.	Cryptocurrency Adoption \rightarrow Financial Literacy \rightarrow Financial Inclusion	0.28 (indirect effect)	<0.01	Supported (partial mediation effect)
H3: Digital infrastructure moderates the effect of cryptocurrencies on financial inclusion.	Cryptocurrency Adoption \times Digital Infrastructure \rightarrow Financial Inclusion	0.32 (moderating effect)	<0.05	Supported (positive moderating effect)

H1: Cryptocurrency adoption has a positive and significant impact on financial inclusion ($\beta = 0.45$, $p < 0.001$). This confirms that cryptocurrencies can play an important role in improving access to financial services, particularly for unbanked populations.

H2: Financial literacy partially mediates the effect of cryptocurrencies on financial inclusion ($\beta = 0.28$, $p < 0.01$). This underscores the importance of understanding financial concepts to maximize the impact of cryptocurrencies. Individuals with better financial literacy are more likely to adopt and use these technologies to access financial services.

H3: Digital infrastructure positively moderates the effect of cryptocurrencies on financial inclusion ($\beta = 0.32$, $p < 0.05$). This suggests that access to the internet and digital technologies amplifies the impact of cryptocurrencies by facilitating their adoption and usage. This highlights the need to invest in digital infrastructure to maximize the benefits of cryptocurrencies.

Further tests confirm the goodness of fit of the model (Table 5). The Comparative Fit Index (CFI), with a value of 0.94 (greater than 0.90), demonstrates an excellent fit with the data. This indicates that the proposed theoretical model is well supported by empirical data. Similarly, the Tucker–Lewis Index (TLI), with a value of 0.92 (greater than 0.90) also confirms a good model fit, reinforcing the validity of the structural model used to test the hypotheses. Finally, the Root Mean Square Error of Approximation (RMSEA), with a value of 0.06 (less than 0.08), exhibits a good fit, meaning that approximation errors are low and the model is well suited to the data. Figure 4 visually confirms the overall goodness-of-fit indices of the model.

Table 5. Model fit indices for SEM: goodness of fit.

Fit Index	Value	Reference Threshold	Result
CFI (Comparative Fit Index)	0.94	>0.90	Good fit
TLI (Tucker–Lewis Index)	0.92	>0.90	Good fit
RMSEA (Root Mean Square Error of Approximation)	0.06	<0.08	Good fit

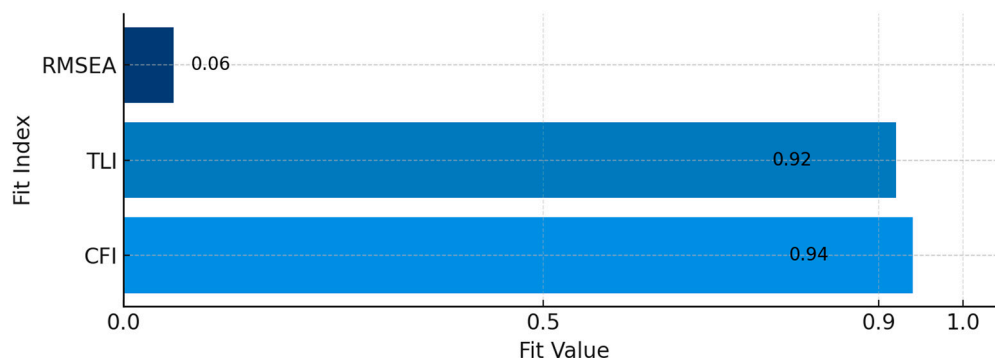

Figure 4. SEM model fit indices.

Confirmatory factor analysis (CFA) indicates that all factor loadings exceed 0.65, indicating good convergent validity (Table 6). The indicators are strongly linked to their respective latent variables, confirming the robustness of the measurements. For cryptocurrency adoption, transaction volume (loading = 0.82) is a particularly strong indicator, suggesting that cryptocurrency users engage in significant transactions. For financial inclusion, access to credit (loading = 0.73) is a crucial indicator, demonstrating that credit access is a key aspect of financial inclusion. For financial literacy, the comprehension score (loading = 0.80) is a strong indicator, highlighting the importance of understanding basic financial concepts. For digital infrastructure, smartphone ownership (loading = 0.75) is a key indicator, showing that access to mobile devices is essential for cryptocurrency adoption.

Table 6. Results of confirmatory factor analysis (CFA).

Variables	Indicators	Factor Loading	
Cryptocurrency Adoption	Ad1	Frequency of use	0.75
	Ad2	Transaction volume	0.82
	Ad3	Knowledge of cryptocurrencies	0.68
	Ad4	Future intention to use	0.71
Financial Inclusion	IF1	Number of bank accounts	0.70
	IF2	Frequency of use	0.65
	IF3	Access to credit	0.73
	IF4	Use of savings services	0.69
Financial Literacy	LF1	Understanding score	0.80
	LF2	Knowledge of interest rates	0.75
	LF3	Ability to compare offers	0.72
	LF4	Personal budget management	0.68
Digital Infrastructure	DI1	Internet access	0.72
	DI2	Smartphone ownership	0.75
	DI3	Quality of connectivity	0.68
	DI4	Frequency of Internet usage	0.70

As regards *p*-values, all *p*-values are below 0.001, confirming that the relationships between indicators and latent variables are statistically significant. Figure 5 summarizes the standardized factor loadings for all indicators.

Figure 5. Standardized factor loadings for each measurement item in the confirmatory factor analysis (CFA).

In summary, all three hypotheses were supported by the results, confirming clear relationships between cryptocurrency adoption, financial inclusion, financial literacy, and digital infrastructure. The following section looks beyond these statistical results to discuss related issues.

5. Discussion

The above results confirm the validity of the three hypotheses posited above, but beyond this, these results raise a number of issues worthy of further discussion.

Firstly, the results indicate that cryptocurrencies have a positive and significant impact on financial inclusion ($\beta = 0.45$, $p < 0.001$) in the context of the study population. This relationship suggests that cryptocurrencies can play a crucial role in improving access to financial services, particularly for unbanked populations. These findings align with the work of [Tapscott and Tapscott \(2017\)](#), which emphasizes the potential of cryptocurrencies to reduce transaction costs and facilitate money transfers, especially in developing countries. In Morocco, where a significant portion of the population remains excluded from the traditional banking system, cryptocurrencies could thus offer a viable alternative for accessing basic financial services.

Secondly, financial literacy can play a crucial mediating role in the impact of cryptocurrencies on financial inclusion ($\beta = 0.28$, $p < 0.01$). This suggests that individuals with better knowledge and understanding of financial concepts are more likely to adopt and use cryptocurrencies to access financial services. This finding is consistent with the conclusions of [Lusardi and Mitchell \(2014\)](#), who demonstrated that financial literacy is a key determinant in the adoption of financial innovations. Nevertheless, the observed effect size—although statistically significant—remains moderate in magnitude. This calls for a cautious interpretation of the policy implications, particularly when extrapolating to broader populations. As [Gelman and Loken \(2014\)](#) cautioned, modest statistical associations can often be overinterpreted when translated into large-scale policy decisions, especially in fields where social, behavioral, and contextual factors are heterogeneous and dynamic. In the Moroccan context, this underscores the importance of strengthening educational programs aimed at improving knowledge of cryptocurrencies and emerging financial technologies. Furthermore, recent evidence from Africa has indicated that digital

financial inclusion can also promote women’s labor force participation, particularly when access to mobile technologies and digital services is expanded. However, gender-specific barriers such as limited access to smartphones and high service costs continue to hinder the full potential of these technologies for female empowerment (Elouardighi & Oubejja, 2023).

Thirdly, in this study, digital infrastructure positively moderates the effect of cryptocurrencies on financial inclusion ($\beta = 0.32, p < 0.05$). This suggests that access to the internet and digital technologies amplifies the impact of cryptocurrencies by facilitating their adoption and usage. These results are in line with GSMA (2017), which underscores the importance of digital infrastructure for the development of digital financial services. In Morocco, where rural areas still suffer from limited internet access, investing in digital infrastructure could therefore be a key strategy to maximize the benefits of cryptocurrencies. These two factors—the significance of financial and technology literacy and the availability of digital infrastructure—align with other wider studies on achieving successful digitalization in developing country environments (Wynn et al., 2024).

Fourthly, this study makes several contributions to the existing literature in this field. On the one hand, it represents a new application of the UTAUT model by integrating variables specific to the Moroccan context, such as financial literacy and digital infrastructure. On the other hand, it empirically validates the role of cryptocurrencies in financial inclusion by highlighting the underlying mechanisms (direct, mediating, and moderating effects). In addition, by focusing on Morocco, this study helps fill a gap in the literature, providing valuable insights for developing countries facing similar challenges. The development of an operational model to underpin the introduction of cryptocurrencies would be a valuable next step. This could usefully build upon existing models such as, for example, the Design–Actuality gap model developed by Heeks (2002). Such implementation frameworks could center on the key change dimensions identified in this study: cryptocurrency availability and regulation (process), financial literacy progression (people), and digital infrastructure availability (technology). An initial representation of relevant factors is depicted in Figure 6.

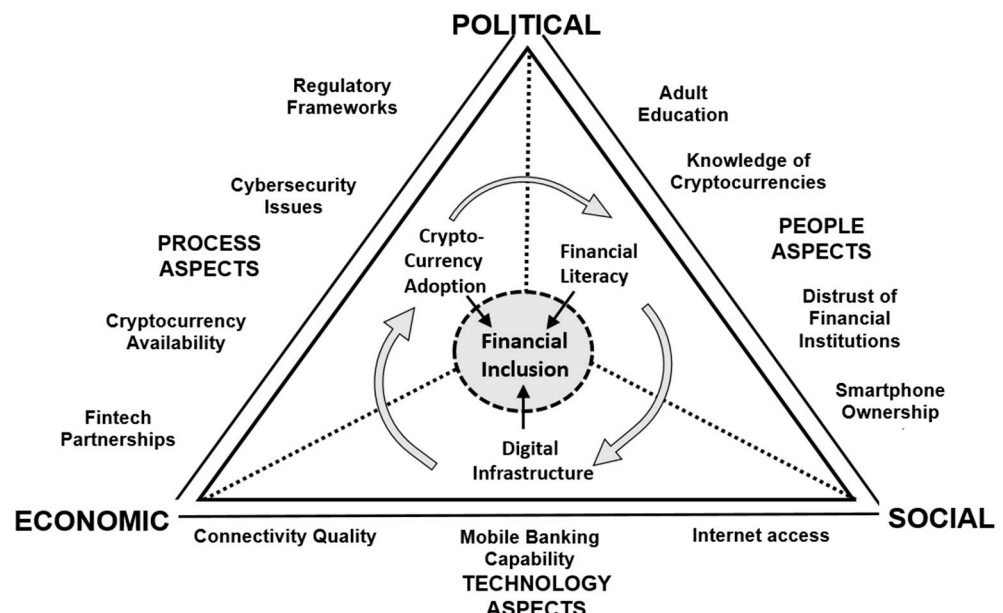

Figure 6. Framework of key factors for financial inclusion and cryptocurrency adoption in emerging economies.

Fifthly, this framework—articulating the interaction between cryptocurrency adoption, financial literacy, and digital infrastructure—presents a flexible structure that can be transposed to other developing economies with similar institutional and socio-economic

characteristics. Many countries in the Global South face converging constraints, such as low banking penetration, fragmented regulatory oversight, and high levels of financial exclusion (Zins & Weill, 2016). As Klapper and Lusardi (2020) emphasized, effective financial inclusion strategies must reflect national specificities while offering adaptable pathways to guide reforms in low-income contexts. Furthermore, Ozili (2022) argued that digital finance in Africa requires a policy architecture that addresses both infrastructural limitations and informal financial behaviors, underscoring the need for frameworks that are simultaneously context-sensitive and structurally transferable. This need was further reinforced by Ozili (2023a), who highlighted the importance of appropriate governance to align fintech innovation, crypto-assets, and financial stability objectives. This argument was supported by Zins and Weill (2016), who demonstrated that the determinants of financial inclusion in Sub-Saharan Africa are largely shaped by similar macro-institutional dynamics, such as education levels, income, and trust in formal institutions. Finally, Dirk Zetzsche et al. (2020) stressed the necessity of integrated approaches that link financial inclusion, sustainability, and financial technologies in emerging markets. From this perspective, the model proposed in this study not only offers a robust analytical lens for understanding decentralized financial practices in Morocco but also provides a scalable foundation to inform public policy and academic research in other emerging economies undergoing comparable digital transitions.

Sixthly, cryptocurrencies may potentially play a key role in the growing use of “mobile money”, which encompasses financial transactions and services that can be carried out using a mobile device such as a mobile phone or tablet. GSMA (2017) reported that, to the south of Morocco, “over the past few years, West Africa has emerged as mobile money’s new powerhouse” (p. 6). Furthermore, mobile money is seen “as a key enabler of the United Nations’ Sustainable Development Goals (SDGs)”, and that “many mobile money users are now able to access productive services that were previously inaccessible” (p. 7). In this context, Sila (2022) recently observed “with the introduction of cryptocurrency and its increased usability, mobile banking needs to consider the ways that cryptocurrency transfers can be integrated into mobile banking, ACH {automated clearing house} digital wallets, and online banking methods” (para. 2). For policymakers, it is essential to establish a clear regulatory framework to govern cryptocurrency use while promoting its responsible adoption via mobile and other devices. Initiatives aimed at improving financial literacy and strengthening digital infrastructure should also be prioritized. For financial institutions, partnerships with fintech firms could enable the integration of cryptocurrencies into their service offerings, while educational programs could enhance understanding and acceptance of these technologies. Fintech stakeholders need to provide solutions tailored to the needs of unbanked populations, particularly in rural areas, whilst also ensuring security and ease of use.

Seventh, although cryptocurrencies are frequently presented as disruptive instruments capable of promoting financial inclusion, their deployment raises a series of structural, technical, and socio-economic risks that require careful scrutiny. These technologies, often perceived as neutral and emancipatory, can, on the contrary, exacerbate existing vulnerabilities when introduced into fragile or weakly regulated institutional environments.

A primary concern lies in the extreme volatility of cryptocurrencies. As highlighted by Almeida et al. (2022), crypto markets are marked by persistent instability, subject to speculative dynamics amplified by the absence of regulatory mechanisms comparable to those found in traditional financial markets. This volatility disproportionately exposes the most vulnerable populations to significant financial losses, thereby diminishing the potential benefits in terms of financial inclusion. Similarly, R. Khan and Hakami (2022) emphasized that price instability remains a major barrier to the sustainable adoption of digital assets.

These risks are compounded by systemic threats linked to fraud, money laundering, and terrorist financing—risks largely facilitated by the anonymity and decentralization inherent to blockchain-based transactions. Research by [Desmond et al. \(2019\)](#) and [Akartuna et al. \(2022\)](#) demonstrated that cryptocurrency systems are particularly vulnerable to illicit uses due to low traceability and a lack of built-in governance mechanisms. [Adamyk et al. \(2025\)](#) further stressed the need to strengthen transaction tracking platforms within the decentralized finance (DeFi) ecosystem in order to mitigate the criminal misuse of unregulated financial flows.

In addition, technological exclusion remains a critical barrier to the equitable adoption of cryptocurrencies. In many regions of the Global South, deficits in digital infrastructure, the high cost of compatible devices, and widespread digital illiteracy significantly hinder access to crypto-asset management platforms ([Muralidhar & Lakkanna, 2024](#)). In this context, [G. Kumar et al. \(2024\)](#) highlighted the central role of digital and financial literacy as a prerequisite for the effective inclusion of marginalized populations. [Lusardi and Mitchell \(2014\)](#) also pointed out that individuals with low levels of financial literacy are more likely to make poor financial decisions or fall victim to exploitative practices, potentially turning what is meant to be a tool of inclusion into one of exclusion.

Finally, the absence of a unified regulatory framework further exacerbates these uncertainties. As noted by [Dirk Zetsche et al. \(2020\)](#), the rapid expansion of decentralized finance without proper oversight increases the risk of financial fragmentation and opportunistic behavior. Implementing adaptive regulatory mechanisms—such as regulatory sandboxes—could represent a pragmatic response, provided they are supported by effective institutional coordination and user-targeted education efforts ([Makarov & Schoar, 2022](#); [Gelman & Loken, 2014](#)). Therefore, while cryptocurrencies may offer a promising opportunity to foster financial inclusion, they should not be regarded as universal or risk-free solutions. Careful regulation, combined with targeted educational initiatives, is a strategic imperative to ensure these technologies do not exacerbate the very inequalities they aim to address.

To align with international best practices, policymakers in developing and emerging economies should adopt a regulatory stance that is adaptive, inclusive, and structurally coherent. One effective strategy involves the deployment of regulatory sandboxes, which provide fintech innovators and blockchain developers with controlled environments to test digital financial solutions under public authority supervision. This approach has shown significant benefits in jurisdictions as demonstrated by [Cumming et al. \(2019\)](#). At the same time, it is essential to strengthen consumer protection regarding decentralized financial products and services, particularly in terms of transparency, auditability, and transaction security. As argued by [Adamyk et al. \(2025\)](#), enforcing disclosure requirements, implementing third-party audits of smart contracts, and establishing accessible dispute resolution mechanisms can significantly enhance user trust in decentralized ecosystems.

Furthermore, regulatory frameworks must integrate the promotion of financial and digital literacy as a cornerstone of safe adoption. Vulnerable populations, often lacking the necessary skills to assess risks, are disproportionately exposed to fraud, asset mismanagement, and manipulation ([Lusardi & Mitchell, 2014](#); [G. Kumar et al., 2024](#)). Regulatory efforts should thus be accompanied by state-sponsored educational programs aimed at fostering informed participation in digital financial ecosystems. Institutional coordination is also imperative: central banks, financial supervisory authorities, data protection agencies, and digital innovation hubs must collaborate to ensure that the proliferation of cryptocurrencies does not outpace the protective capacity of current legal and regulatory structures ([Makarov & Schoar, 2022](#)).

Finally, in regions such as Sub-Saharan Africa and the MENA zone, regional harmonization of standards could serve as a catalyst for interoperable and cross-border solutions, thereby reducing the risk of regulatory arbitrage while supporting inclusive remittance frameworks. Ultimately, only a context-sensitive, forward-looking regulatory environment rooted in user protection and empowerment can ensure that the diffusion of cryptocurrencies and decentralized finance strengthens—rather than undermines—financial inclusion and socio-economic resilience (El Hajj & Farran, 2024).

6. Conclusions

This study explored the role of cryptocurrencies in financial inclusion in Morocco, shedding light on the key mechanisms influencing their adoption and impact. The findings reveal that cryptocurrencies have a positive and significant impact on financial inclusion, confirming their potential to improve access to financial services, particularly for unbanked populations. Additionally, financial literacy plays a crucial mediating role, emphasizing the importance of understanding financial concepts for the adoption of these technologies. Further, digital infrastructure positively moderates this impact, highlighting the need to invest in digital technologies to maximize the benefits of cryptocurrencies. From a theoretical perspective, this study extends the UTAUT model by incorporating variables specific to the Moroccan context, such as financial literacy and digital infrastructure, and empirically validates the role of cryptocurrencies in financial inclusion. The study demonstrates that cryptocurrencies hold significant potential to enhance financial inclusion in Morocco, provided that efforts are made to strengthen financial literacy, improve digital infrastructure, and establish an appropriate regulatory framework. By fully leveraging these innovations, Morocco could take a significant step toward broader financial inclusion and sustainable socio-economic development. The findings also support the formulation of a more generalized conceptual model that provides an outlined analytical framework applicable to similar developing world environments. One particular issue of note is the need for appropriate safeguards and regulatory regimes to ensure the safe and inclusive integration of digital financial tools in emerging economies. The current diversity of national regulations—ranging from outright bans to sandbox experimentation—reflects a lack of global convergence that may hinder innovation while exposing users to significant risks.

This study has a number of limitations. Firstly, the sample may not be fully representative of the Moroccan population due to challenges in accessing rural areas, and future studies could valuably include a larger and more diverse sample. Secondly, self-reported data may be subject to social desirability bias, despite the use of mixed methods (quantitative and qualitative) to triangulate the results and enrich the analysis. Thirdly, the framework put forward in the Discussion is but an initial assessment of the key variables involved in the adoption and impact of cryptocurrencies and is not a definitive analytical model. Finally, this study focuses on Morocco, which limits the generalizability of the findings to other contexts, as pointed out by Yin (2018). Flyvbjerg (2006, p. 223), however, maintained that in producing “concrete, context-dependent knowledge”, such cases have an intrinsic value, and the authors believe that the outlined conceptual model, as well as the detailed findings, will be of interest to researchers and policymakers in similar environments.

Several future research directions are thus worthy of exploration. As noted above, longitudinal studies could examine the evolution of cryptocurrency adoption in other environments to underpin the development of an implementation model and guidelines. International comparisons could also be conducted to compare Morocco’s results with those of other developing countries where the role of digitalization in the financial sector is

under study (Zetzsche et al., 2019). The impact of regulations on cryptocurrency adoption and their role in financial inclusion is another area that could usefully be researched.

In conclusion, this study highlights the potential of cryptocurrencies to enhance financial inclusion in Morocco while emphasizing the importance of financial literacy and digital infrastructure. These insights provide a solid foundation for policy and strategic recommendations aimed at integrating cryptocurrencies responsibly into Morocco's financial system. By establishing a clear regulatory framework, strengthening financial literacy, and improving digital infrastructure, Morocco could fully leverage cryptocurrencies to achieve its financial inclusion and socio-economic development goals. This study thus makes a small contribution to addressing a gap in the literature regarding the role of cryptocurrencies in developing countries and opening avenues for future research, particularly on regulatory impacts and international comparisons.
